Module Description

N.B. This module will be offered as 'Assessment Only' in Fall / Winter semesters.

This module explores the new and emerging role for design in industry and its contribution to product innovation and value proposition. It provides students with an overview of how to determine what to make and do, why to do it, and how to innovate contextually, both immediately and over the long-term. This further enables students to create meaningful products—services with character—by considering relevant touch-points. Thereby students learn techniques like market and brand analyses, future scenarios, technology forecasting and roadmapping as drivers for strategic design.

General Guideline

In any assessment, three elements have to be demonstrated together:

- Knowledge
- Application of knowledge
- Reflection on the application of knowledge.

Qualification Objectives:

The individual student work is assessed holistically and is required to evidence the following learning outcomes/qualification objectives through the ability to:

- **Identify and utilize a range of methods to assist in the strategic development of your project (e.g. future scenarios, technology forecasting, storyboarding, user stories etc.)**
- **Develop clear avenues for 'creative outcome' development (e.g. design product, service, experience, analog object) that are contextually appropriate**
- **Create project development milestones and/or time plans that are contextually appropriate and acknowledge local/global developments (e.g. technological, political, social)**
- **Present work in a creative, coherent and concise manner (which includes adherence to the word count, proper referencing and citation and the use of contextually located images).**

Level Expectations

Level 0: The student demonstrates applied knowledge in all areas of the core competencies
mentioned above. They delivered all points mentioned in the assessment instructions. Their
knowledge shows gaps with respect to the full scope of the module (e.g., incomplete series).
Their reflection is limited by these gaps and/or by a narrow scope of experience in
