Module Description

IMPORTANT: To pass this module successfully, attend the LU series and use the learning resources in the Google Classroom for additional self-directed learning to get prepared for the assessment.

Overall, this module helps students to develop an in-depth understanding of the product discovery process and equips them with practical skills to navigate through the early stages of product development. It provides an overview of the product discovery process based on Generative AI and HI (Human Intelligence) tools to define a problem worth solving, identify user needs, understand the market, generate ideas, and validate prototypes to develop a Minimum Viable Product (MVP). Starting with a clearly defined problem or opportunity, students learn how to design a product with a measurable impact based on hands-on group work activities. As part of the discovery process, students learn how to utilize methods for Customer Discovery, Market Research, Ideation, Prototyping, and the evaluation of product ideas.

Qualification Objectives

Students who successfully pass this module are able to:

- Analyze different external factors to understand the market that influences a business
- Apply user research methods to identify user needs and generate user insights
- Apply creativity techniques to generate a wide range of ideas to solve a problem
- Create prototypes and user tests to validate concepts based on a hypothesis
- Evaluate solutions based on criteria such as desirability, feasibility, viability, and sustainability

Knowledge Areas

- Problem/Opportunity identification and definition
- Customer Discovery & Market Research (Market including market size and market growth, external factors, target audience, and competitors)
- Solution ideation process and creativity techniques
- Collaborative product design and prototyping
- Solution/Product validation (desirability, usability, feasibility, viability, sustainability)
- Minimum Viable Product (MVP) definition & Build-Measure-Learn feedback cycle

Level Expectations

The general CODE Level Descriptions apply.
