Module Description

Artificial intelligence (AI) and machine learning (ML) techniques are rapidly entering mainstream use in a wide variety of digital product contexts. This module explores AI and ML as design materials, investigating the potentials and challenges of AI techniques in an interaction design and creative context. Indicative areas of study in this module include: An introduction to the current AI arena and machine learning environment, including techniques and domains such as Speech to Text (STT), Text to Speech (TTS), Computer Vision (CV), Machine Learning (ML) applications of neural network types, Large Language Models, and applications and processes of large data sets. The course also considers issues associated with AI and machine learning regulatory frameworks and ethics. Additional indicative study areas include the creation and use of datasets (e.g., expert systems, recommender systems, computer vision, and machine learning), practical applications of ML and AI techniques approached from a design context, and the use of high-level tools in prototype scenarios and discussion of the creative and design opportunities and challenges of working with smart tools and processes.

This module is taught as a Studio Module, with mandatory participation every week, exploring principles, ideas and design techniques and using simple code and design prototyping examples exploring different topics. There will be reading tasks and examples set as preparation for each session that are expected to be completed in advance, week by week. We will use elements of the coding environment p5.js / Processing so a basic understanding of coding is expected.

Level Expectations

Level 0: The student demonstrates applied knowledge in all areas of the core competencies
mentioned above. They delivered all points mentioned in the assessment instructions. Their
knowledge shows gaps with respect to the full scope of the module (e.g., incomplete series).
Their reflection is limited by these gaps and/or by a narrow scope of experience in applying
the knowledge.

Level 1: The student demonstrates a broad knowledge of most topics covered by the module.
They demonstrate this knowledge by showing how they applied it in all four phases mentioned above, and they reflect on the application and their own level of knowledge,
including which gaps they see in their knowledge. They delivered all points mentioned in the
