Module Description

Is generative AI the next revolution for the product world? What happens next? Will we see different ways to find and deliver value to our users and their communities, and will we do so in fundamentally different product organizations? Regardless of how these questions will be answered and how AI evolves in the future, generative AI is here and profound impacts on product management and adjacent disciplines can already be seen. While generative AI gets most of the attention, we should not overlook the essential role product and data culture play in making it useful for product development.

General Guidelines

In any assessment, three elements have to be demonstrated together:

- knowledge,
- application of knowledge,
- reflection on the application of knowledge.

Knowledge Areas

Chat-based tools for Product Management

- How do you get the most out of LLMs for your specific use case?
- How do you make use of LLM-based tools in your product operations environment?

Data Culture

- What are the components of your data infrastructure in your project?
- What are the components of the data culture in your project?
- How do you approach data ethics?

AI-enabled Products

- How do you find out where generative AI could add user value?
- How do you ensure the ethical use of generative AI in your product?
- How do you measure the success of AI-enabled features / products?

Level Expectations

The general CODE Level Descriptions apply.

Standard Assessment Instructions

This is a **portfolio assessment with optional oral exam**. You are expected to hand in concrete examples demonstrating your applied (not theoretical) responses to all of the questions mentioned in the knowledge areas. This must include at least one detailed, product- or operations-related prompt for an LLM of your choice, which must be accessible to the assessor (the assessor must be able to use the prompt)
